                                                                                                                 PT Single chain antibodies specific for erbB-2 protein, gp185 - with pT labels or cytotoxin, useful for detection and treatment of tumour PT cells expressing this protein
PS Example 9; Columns 27-30; 28pp; English.

CC The present cDNA sequence codes for a claimed single-chain antibody, e21
CC designated e21(FV), which binds to erbB-2. Monoclonal antibody e21
CC was generated by immunising mice with N/erbB-2 cells overexpressing CC was generated by immunising mice with N/erbB-2 cells overexpressing CC the gp185 protein, removing spleen cells and producing hybridomas CC by standard techniques. Messenger RNA coding for the anti-erbB-2 CC monoclonal antibody was isolated and converted to cDNA. Regions CC coding for the heavy- and light- chain variable regions were then CC linker. The resulting single-chain antibody is useful for in vitro CC diagnosis of tumour cells which overexpress the erbB-2 gp185 cC marker, e.g. breast, overlan and non-small cell lung carcinomas, CC and, when coupled to a cytotoxic agent, to treat such tumours.

PT Inhibition of proliferation or survival of, esp. malignant erbB2, protein intracellularly

PS calim 42; Page 29-30; 48pp; English.

CC (R94019) linked to a second sequence encoding a signal peptide chain Fv fragment (R94020) that binds a human erbB2 oncoprotein.

CC The anti-erbB2 sFv portion is obtained by PCR using e23scFv

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plasmid as template. The signal peptide directs the scFv to the endoplasmic reticulum. The nucleic acid is incorporated into a plasmid or viral vector to facilitate expression of the scFv antibody homologue within e.g. an epithelial carcinoma cell. Intracellular expression of the homologue inhibits surface expression of erbB2 and thereby inhibits cell proliferation and cell survival and decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       tumorigenicity.

                                                                                                                                                                                                                                                                                                                                                                       Immunosuppressant polypeptide - has ability to block interleukin-2 response Claim 17; Page 29; 37pp; English.

MAb capable of binding to the gamma chain of the IL-2 recept thus of blocking the IL-2 response, is produced by mouse hyt line GP-2 (FERM BP-4641). DNA encoding the variable region this MAb was expressed in E. coli, yielding Fv(GP-2) with immunosuppressive activity.

Example; Fig 7; 37pp; English.

The source of human erbB-2 protein for the prodn. of antibodies not a source of human erbB-2 protein on its surface (Ny erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

Disclosure; Fig 3; 26pp; English.

The sequence is an NdeI-HindIII fragment encoding the L and H chains of murine MAD OVB3, joined together via a linker. The sequence is present in clone poVB3158-1 in which the 3' end is linked to the 5' end of the coding sequence for PE40, a a Pseudomonas exotoxin lacking domain I. The protein expressed by the clone can be used to kill specific target cells.

The sequences given in T91614-15 encode single chain Fv (scFv) antibodies which are produced in E. coli. The scFv's are derived from an anti-T3 antibody or an anti-T9130 antibody and are produced either by: (1) expression as an inclusion body, followed by folding (i.e. by denaturation and solubilisation) or (2) expression as a soluble fraction by co-expression with chaperonin. Using the methods, scFv can be produced in E. coli, either in a soluble fraction or in inclusion bodies. Like the parent double chain antibodies, the scFv polypeptides are useful in immunological diagnosis or for separation and purification, but they lessen the side effects caused by antibody constant regions. The availability of scFv polypeptides contributes to fundamental research and development of diagnostic and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

Producing single chain Fv antibody in Escherichia coli - by expression in an inclusion body, followed by protein folding or by co-expression with a chaperonin as a soluble fraction co-expression with a chaperonin as a soluble fraction co-expression with a chaperonin as a soluble fraction of the sequences given in T91614-15 encode single chain Fv (scFv) antibodies which are produced in E.coli. The scFv's are derived crown an anti-T3 antibody or an anti-T9130 antibody and are produced in E.coli. The scFv and are produced cither by: (1) expression as an inclusion body, followed by folding (i.e. by denaturation and solubilisation) or (2) expression as a soluble fraction by co-expression with chaperonin. Using the methods, scFv can be produced in E. coli, either in a soluble fraction or in inclusion bodies. Like the parent double chain antibodies, the scFv polypeptides are useful in immunological diagnosis or for separation and purification, but they lessen the side effects caused by antibody constant regions. The availability of scFv polypeptides contributes to fundamental research and development of diagnostic and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                              The single chain polypeptide is derived from the mature light and chavy chains of a monoclonal antibody (MAD) and has affinity for a given antigen (Fluorescein). It comprises a first c polypeptide comprising the antigen binding portion of of the light c chain variable region of an antibody and a second polypeptide comprising the antigen binding portion of the heavy chain variable region of an antibody and at least one peptide linker linking the cregion of an antibody and at least one peptide linker linking the first and second polypeptide chains. The resulting single chain c polypeptide can be used in diagnostics, therapy (in vivo and in vitro), imaging, purifications and biosensors. This particular single chain binding molecule was designated 18-2-3/TRY202' and contains one linker peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immuno:purifich. using single binding chain molecule including antigen-binding parts of antibody light and heavy chain variable regions connected by a linker - is smaller, stabler and less expensive than complete antibodies

Example 9; Fig 39; 78pp; English.

A DNA construct (713739) codes for single chain binding molecule in-2-3/TRY202/2 (R99649), in which VL and VH regions of anti-cliner composed primarily of alternating Gly and Ser residues, with inker composed primarily of alternating Gly and Ser residues, with expressed in E.coli. Soluble, folded chain antibody (SCA) was expressed in E.coli. Soluble, folded chain antibody (SCA) was obtd. which was capable of exhibiting a biological binding activity equivalent in specificity and affinity to that of a monoclonal antibody. The SCA has the advantages of smaller size, greater stability and reduced cost.

Example 9; Fig 39A-B; 78pp; English.

Computer-designed construct 18-2-3/TRY202' (W02191), encoded by the DNA sequence given in T36463, comprises the variable regions of the light and heavy chains of anti-fluorescein monoclonal antibody (Mab) 18-2-3 linked by a peptide designed to fit into a groove on the backside of the variable domain structure. The 18-2-3 VH and VL regions were obtd. by CR amplification of hybridoma RNA, and the DNA construct was inserted into vector pGX3703 and introduced into E. coll. 18-2-3/TRY202' was expressed as a single chain molecule. It exhibited biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US5518889-A.

                                                                                                                The sequence was constructed from the variable regions of an antifluorescein MAD, 18-3-2, an IgM. The VI and VH CDNA sequences were synthesised by priming on RNA isolated from hybridona cells. The sequence encodes a single chain binding molecule comprising the variable regions of heavy and light chains linked by peptides. The peptide linker was computer-designed to fit inyo a groove on the backside of the variable domain structure and is composed primarly of alternating Gly and Ser residues. Glu and Lys residues are included to enhance solubility.

PT Single chain poly:peptide for binding antigen - comprising light and heavy chain antigen binding portions linked by peptide linker and heavy chain antigen begins and an antibody (MAb) and has affinity CC for a given antigen (Bovine growth hormone). It comprises a first CC polypeptide comprising the antigen binding portion of of the light CC chain variable region of an antibody and a second polypeptide comprising the antigen binding portion of the heavy chain variable region of an antibody and a second polypeptide comprising the antigen binding portion of the heavy chain variable comprising the antigen binding portion of the heavy chain variable cregion of an antibody and at least one peptide linker linking the cregion of an antibody and at least one peptide linker linking the colypeptide can be used in diagnostics, therapy contains one linker peptide.

pr immuno:purificn. using single binding chain molecule including practices antigen-binding parts of antibody light and heavy chain variable presents connected by a linker is smaller, stabler and less presents than complete antibodies

Presents than complete antibodies

Example 3; Fig 28; 78pp; English.

A DNA construct (T13737) codes for single chain binding molecule TRT59 (R99647), in which amino acids (aa) 1-105 of the VL region of anti-bovine growth hormone mouse IgG1 monoclonal antibody 3C2 and aa2-123 of the 3C2 VH are joined by a peptide linker from the TV region of the 13A anti-phosphorylcholine myeloma antibody MCPC-603. The construct was expressed in E.coli. Single chain binding molecules retain the specificity of the heavy and light chain aggregate variable region of the native antibody but have the advantages of smaller size, greater stability and reduced cost.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
